

ABSTRACT

In one embodiment, a sheet media input structure includes a sheet supporting surface, a movable pad downstream from the supporting surface, and a pair of stationary pads downstream from the supporting surface at a location where the stationary pads impede a leading edge of sheets fed from a stack of sheets supported by the supporting surface. The movable pad is movable between a first position in which the movable pad impedes a leading edge of sheets fed from the stack and a second position in which the movable pad does not impede the leading edge of sheets fed from the stack.
